

a**A nearest-gene prior also fails to beat the floor***every gene-side transfer sits below the simple cell-mean floor*

Nearest-gene priors predict a held gene's effect as the observed training effect of its single nearest training gene, by co-expression-graph NN on control cells, or by GO-term Jaccard NN.

Scored on the identical downstream-only Pearson-Δ, splits and units as the deep models. † CINEMA-OT is a perturbation-agnostic OT floor (not headline-ranked).

b**Robustness to holdout fraction***floor leads at every holdout level*
