

Immune perturbation prediction: from task to evidence

Five tasks · three intervention classes · task-specific information boundaries

Shared input preparation: QC, feature selection and task-specific normalization

Interpret the margin, not just the rank

Above both references? → Check paired uncertainty, multiplicity, readout estimability and external validity.

Scope: shared upstream feature selection is not fully inductive. T4 does not hold out the protein modality.
Compact prediction profiles reproduce Pearson-Δ; they do not retain the cell clouds needed for energy-distance replay.
